8. Integration Examples

Prerequisites

System Requirements

- **Operating System**: Linux, macOS, or Windows (with WSL2)
- **Memory**: 8GB RAM minimum, 16GB recommended
- **Storage**: 50GB available space
- **Network**: Stable internet connection

Required Software

```bash
```

```bash
# Install Rust
curl --proto '=https' --tlsv1.2 -sSf https://sh.rustup.rs | sh
source ~/.cargo/env

# Install Sui CLI
cargo install --locked --git https://github.com/MystenLabs/sui.git --branch devnet sui

# Install Node.js (for TypeScript SDK)
curl -fsSL https://deb.nodesource.com/setup_18.x | sudo -E bash -
sudo apt-get install -y nodejs

# Install Python (for testing framework)
sudo apt-get install python3 python3-pip
pip3 install asyncio pytest pysui
```

Verification

```bash
# Verify installations
sui --version
node --version
python3 --version
rustc --version
```

Local Development Setup

1. Initialize Sui Local Network

```bash
# Start local Sui network
sui start --with-faucet --force-regenesis

# Verify network is running
sui client active-env
```

2. Create and Configure Wallet

```bash
```

```
# Generate new keypair
sui client new-address ed25519

# Request test tokens from faucet
sui client faucet

# Check balance
sui client balance
```

3. Set Up Project Structure

```bash
mkdir cti-platform-sui
cd cti-platform-sui

# Create Move project
sui move new cti_platform

# Create additional directories
mkdir -p {sdk,tests,docs,scripts}
```

Smart Contract Deployment

1. Prepare Move Package

```bash
```

```
cd cti_platform

# Create Move.toml
cat > Move.toml << EOF
[package]
name = "cti_platform"
version = "1.0.0"
edition = "2024.beta"

[dependencies]
Sui = { git = "https://github.com/MystenLabs/sui.git", subdir = "crates/sui-framework/packages/sui-framework", rev = "

[addresses]
cti_platform = "0x0"
EOF
```

2. Deploy Smart Contracts

```bash
# Build the package
sui move build

# Deploy to local network
sui client publish --gas-budget 100000000

# Save the package ID and object IDs from the output
export PACKAGE_ID="0x..."
export PLATFORM_OBJECT_ID="0x..."
export ADMIN_CAP_ID="0x..."
```

3. Verify Deployment

```bash
# Check deployed objects
sui client object $PACKAGE_ID
sui client object $PLATFORM_OBJECT_ID

# View package info
sui client call --package $PACKAGE_ID --module threat_intelligence --function get_platform_stats --args $PLATFORM_C
```

SDK Integration

1. Install TypeScript SDK

```bash
cd ../sdk
npm init -y
npm install @mysten/sui.js @types/node typescript ts-node

# Create SDK configuration
cat > config.ts << EOF
export const CTI_CONFIG = {
  network: 'localnet' as const,
  packageId: process.env.PACKAGE_ID || '${PACKAGE_ID}',
  platformObjectId: process.env.PLATFORM_OBJECT_ID || '${PLATFORM_OBJECT_ID}',
};
EOF
```

2. Basic Integration Example

```typescript
```

```
// example.ts
import { CTIPlatformSDK } from './cti-platform-sdk';
import { CTI_CONFIG } from './config';

async function main() {
  const sdk = new CTIPlatformSDK(CTI_CONFIG);

  // Generate test keypair
  const keypair = CTIPlatformSDK.generateKeypair();
  console.log('Address:', keypair.getPublicKey().toSuiAddress());

  // Register participant
  const txDigest = await sdk.registerParticipant(
    keypair,
    'Test Organization'
  );

  console.log('Registration successful:', txDigest);
}

main().catch(console.error);
```

3. Run Integration Test

```bash
# Set environment variables
export PACKAGE_ID="your_package_id"
export PLATFORM_OBJECT_ID="your_platform_object_id"

# Run the example
npx ts-node example.ts
```

Testing and Validation

1. Set Up Python Testing Environment

```bash
```

```bash
cd ../tests
python3 -m venv venv
source venv/bin/activate
pip install -r requirements.txt

# Create requirements.txt
cat > requirements.txt << EOF
pytest>=7.0.0
asyncio
pysui
dataclasses
datetime
hashlib
random
json
EOF
```

2. Configure Test Environment

```python
# test_config.py
from dataclasses import dataclass

@dataclass
class TestConfig:
    network: str = "localnet"
    package_id: str = "YOUR_PACKAGE_ID"
    platform_object_id: str = "YOUR_PLATFORM_OBJECT_ID"
    admin_address: str = "YOUR_ADMIN_ADDRESS"
    gas_budget: int = 20_000_000
```

3. Run Comprehensive Tests

```bash
```

```bash
# Run all tests
python -m pytest test_cti_platform.py -v

# Run specific test categories
python -m pytest test_cti_platform.py::test_participant_registration -v
python -m pytest test_cti_platform.py::test_intelligence_submission -v

# Run performance benchmarks
python cti_platform_tester.py
```

4. Analyze Test Results

```bash
# View test report
cat cti_platform_test_report_*.json | jq '.report.test_summary'

# Check performance metrics
cat cti_platform_test_report_*.json | jq '.report.performance_metrics'

# Review security assessment
cat cti_platform_test_report_*.json | jq '.report.security_assessment'
```

Production Deployment

1. Deploy to Sui Testnet

```bash
# Switch to testnet
sui client new-env --alias testnet --rpc https://fullnode.testnet.sui.io:443

# Switch to testnet environment
sui client switch --env testnet

# Get testnet tokens
sui client faucet

# Deploy to testnet
sui client publish --gas-budget 100000000
```

2. Update Configuration for Testnet

```typescript
// config/production.ts
export const PRODUCTION_CONFIG = {
  network: 'testnet' as const,
  packageId: 'YOUR_TESTNET_PACKAGE_ID',
  platformObjectId: 'YOUR_TESTNET_PLATFORM_OBJECT_ID',
  gasPrice: 1000,
  maxGasBudget: 50000000,
};
```

3. Set Up Environment Variables

```bash
# Create .env file
cat > .env << EOF
NODE_ENV=production
SUI_NETWORK=testnet
PACKAGE_ID=your_testnet_package_id
PLATFORM_OBJECT_ID=your_testnet_platform_object_id
ADMIN_PRIVATE_KEY=your_admin_private_key
RPC_URL=https://fullnode.testnet.sui.io:443
EOF
```

4. Deploy API Service

```bash
```

```
# Create Docker container for API service
cat > Dockerfile << EOF
FROM node:18-alpine

WORKDIR /app
COPY package*.json ./
RUN npm ci --only=production

COPY . .
RUN npm run build

EXPOSE 3000
CMD ["npm", "start"]
EOF

# Build and deploy
docker build -t cti-platform-api .
docker run -p 3000:3000 --env-file .env cti-platform-api
```

Monitoring and Maintenance

1. Set Up Monitoring Dashboard

```typescript
```

```typescript
// monitoring/dashboard.ts
import { CTIPlatformSDK, CTIAnalytics } from '../sdk/cti-platform-sdk';

class CTIMonitoringDashboard {
  private sdk: CTIPlatformSDK;
  private analytics: CTIAnalytics;

  constructor(config: any) {
    this.sdk = new CTIPlatformSDK(config);
    this.analytics = new CTIAnalytics(this.sdk);
  }

  async getSystemHealth(): Promise<{
    status: 'healthy' | 'degraded' | 'critical';
    metrics: any;
    alerts: string[];
  }> {
    try {
      const stats = await this.sdk.getPlatformStats();
      const trends = await this.analytics.analyzeThreatTrends(24);

      const alerts = [];
      let status = 'healthy';

      // Check for anomalies
      if (stats.totalSubmissions === 0) {
        alerts.push('No intelligence submissions in last 24 hours');
        status = 'degraded';
      }

      if (stats.feePoolBalance < 1000000) {
        alerts.push('Fee pool balance is low');
        status = 'degraded';
      }

      return {
        status,
        metrics: {
          totalSubmissions: stats.totalSubmissions,
          totalValidations: stats.totalValidations,
          feePoolBalance: stats.feePoolBalance,
          threatTypes: trends.threatTypes,
          submissionTrend: trends.submissionTrend
```

```
      },
      alerts
    };
  } catch (error) {
    return {
      status: 'critical',
      metrics: {},
      alerts: [`System error: ${error.message}`]
    };
  }
}

async startContinuousMonitoring(intervalMinutes: number = 5) {
  setInterval(async () => {
    const health = await this.getSystemHealth();

    console.log(`[${new Date().toISOString()}] System Status: ${health.status}`);

    if (health.alerts.length > 0) {
      console.warn('Alerts:', health.alerts);
      // Send notifications (email, Slack, etc.)
    }

    // Log metrics for historical analysis
    console.log('Metrics:', JSON.stringify(health.metrics, null, 2));
  }, intervalMinutes * 60 * 1000);
}
}
```

2. Automated Health Checks

```bash
```

```bash
#!/bin/bash
# healthcheck.sh

# Check if Sui node is responsive
sui client balance > /dev/null 2>&1
if [ $? -ne 0 ]; then
    echo "ERROR: Sui node is not responsive"
    exit 1
fi

# Check platform stats
STATS=$(sui client call --package $PACKAGE_ID --module threat_intelligence --function get_platform_stats --args $PLA
if [ -z "$STATS" ]; then
    echo "ERROR: Cannot fetch platform statistics"
    exit 1
fi

echo "OK: Platform is healthy"
exit 0
```

3. Log Aggregation and Analysis

```typescript
```

```typescript
// logging/logger.ts
import fs from 'fs';
import path from 'path';

export class CTILogger {
  private logDir: string;

  constructor(logDir: string = './logs') {
    this.logDir = logDir;
    if (!fs.existsSync(logDir)) {
      fs.mkdirSync(logDir, { recursive: true });
    }
  }

  log(level: 'info' | 'warn' | 'error', event: string, data: any) {
    const timestamp = new Date().toISOString();
    const logEntry = {
      timestamp,
      level,
      event,
      data
    };

    // Write to daily log file
    const logFile = path.join(this.logDir, `cti-platform-${new Date().toISOString().split('T')[0]}.log`);
    fs.appendFileSync(logFile, JSON.stringify(logEntry) + '\n');

    // Console output
    console.log(`[${timestamp}] ${level.toUpperCase()}: ${event}`, data);
  }

  async analyzeSubmissionPatterns(): Promise<any> {
    // Analyze log files for submission patterns
    const today = new Date().toISOString().split('T')[0];
    const logFile = path.join(this.logDir, `cti-platform-${today}.log`);

    if (!fs.existsSync(logFile)) {
      return { error: 'No log file found for today' };
    }

    const logs = fs.readFileSync(logFile, 'utf8')
      .split('\n')
      .filter(line => line.trim())
```

```
    .map(line => JSON.parse(line));

  const submissions = logs.filter(log => log.event === 'intelligence_submitted');
  const validations = logs.filter(log => log.event === 'intelligence_validated');

  return {
    submissionCount: submissions.length,
    validationCount: validations.length,
    submissionRate: submissions.length / 24, // per hour
    validationRate: validations.length / 24
  };
 }
}
```

Integration Examples

1. SIEM Integration

```python
```

```python
# integrations/siem_connector.py
import json
import requests
from typing import Dict, Any
from cti_platform_sdk import CTIPlatformSDK

class SIEMConnector:
    def __init__(self, siem_endpoint: str, api_key: str, cti_sdk: CTIPlatformSDK):
        self.siem_endpoint = siem_endpoint
        self.api_key = api_key
        self.cti_sdk = cti_sdk

    async def push_intelligence_to_siem(self, intelligence_data: Dict[str, Any]):
        """Push CTI data to SIEM system"""

        # Convert to SIEM format
        siem_alert = {
            "timestamp": intelligence_data["submission_time"],
            "severity": self._map_severity(intelligence_data["severity"]),
            "threat_type": intelligence_data["threat_type"],
            "indicators": {
                "ioc_hash": intelligence_data["ioc_hash"],
                "stix_pattern": intelligence_data["stix_pattern"],
                "mitre_techniques": intelligence_data["mitre_techniques"]
            },
            "confidence": intelligence_data["confidence_score"],
            "source": "CTI_Platform_Sui",
            "verified": intelligence_data["is_verified"]
        }

        # Send to SIEM
        headers = {
            "Authorization": f"Bearer {self.api_key}",
            "Content-Type": "application/json"
        }

        response = requests.post(
            f"{self.siem_endpoint}/api/v1/alerts",
            data=json.dumps(siem_alert),
            headers=headers
        )

        if response.status_code == 200:
```

```python
        print(f"Successfully pushed intelligence to SIEM: {intelligence_data['threat_type']}")
    else:
        print(f"Failed to push to SIEM: {response.status_code} - {response.text}")

def _map_severity(self, sui_severity: int) -> str:
    """Map Sui severity (1-10) to SIEM severity levels"""
    if sui_severity >= 8:
        return "critical"
    elif sui_severity >= 6:
        return "high"
    elif sui_severity >= 4:
        return "medium"
    else:
        return "low"

async def sync_with_siem(self):
    """Continuously sync new intelligence with SIEM"""
    # Subscribe to intelligence submission events
    await self.cti_sdk.subscribeToEvents(
        self._handle_new_intelligence,
        ["IntelligenceSubmitted", "IntelligenceValidated"]
    )

async def _handle_new_intelligence(self, event: Dict[str, Any]):
    """Handle new intelligence events"""
    if event["type"].endswith("IntelligenceSubmitted"):
        intelligence_id = event["parsedJson"]["intelligence_id"]

        # Get full intelligence data
        intelligence_data = await self.cti_sdk.getThreatIntelligence(intelligence_id)

        if intelligence_data:
            await self.push_intelligence_to_siem(intelligence_data)
```

2. Threat Hunting Integration

```python
```

```python
# integrations/threat_hunting.py
import asyncio
from typing import List, Dict, Any
from cti_platform_sdk import CTIPlatformSDK, CTIAnalytics

class ThreatHuntingConnector:
    def __init__(self, cti_sdk: CTIPlatformSDK):
        self.cti_sdk = cti_sdk
        self.analytics = CTIAnalytics(cti_sdk)

    async def generate_hunting_queries(self, timeframe_hours: int = 24) -> Dict[str, List[str]]:
        """Generate threat hunting queries based on recent CTI"""

        trends = await self.analytics.analyzeThreatTrends(timeframe_hours)
        hunting_queries = {}

        # Generate queries for each threat type
        for threat_type, count in trends["threatTypes"].items():
            queries = []

            if threat_type == "malware":
                queries.extend([
                    "process_name:*.exe AND (network_connections:>10 OR file_modifications:>50)",
                    "registry_modifications:*\\Software\\Microsoft\\Windows\\CurrentVersion\\Run*",
                    "powershell.exe AND (EncodedCommand OR -nop OR -w hidden)"
                ])

            elif threat_type == "phishing":
                queries.extend([
                    "email_subject:*urgent* AND email_attachments:*.exe",
                    "http_requests:*suspicious-domain* OR dns_queries:*malicious*",
                    "browser_downloads:*.zip AND source_url:*shortened*"
                ])

            elif threat_type == "apt":
                queries.extend([
                    "persistence_mechanisms:* AND lateral_movement:*",
                    "credential_access:* AND data_exfiltration:*",
                    "uncommon_processes:* AND network_beaconing:*"
                ])

            hunting_queries[threat_type] = queries
```

```python
    return hunting_queries

async def correlate_with_logs(self, log_sources: List[str]) -> Dict[str, Any]:
    """Correlate CTI data with security logs"""

    correlations = {
        "matches": [],
        "potential_threats": [],
        "recommended_actions": []
    }

    # Get recent high-confidence intelligence
    events = await self.cti_sdk.getRecentEvents(100)
    verified_intelligence = [
        event for event in events
        if event["type"].endswith("IntelligenceValidated")
        and event["parsedJson"]["is_accurate"]
    ]

    # Simulate log correlation (in practice, integrate with actual log systems)
    for intelligence in verified_intelligence:
        threat_type = intelligence["parsedJson"]["threat_type"]

        # Check for matches in logs
        matches = await self._search_logs(intelligence, log_sources)

        if matches:
            correlations["matches"].append({
                "intelligence_id": intelligence["parsedJson"]["intelligence_id"],
                "threat_type": threat_type,
                "matches": matches,
                "risk_score": self._calculate_risk_score(intelligence, matches)
            })

    return correlations

async def _search_logs(self, intelligence: Dict[str, Any], log_sources: List[str]) -> List[Dict[str, Any]]:
    """Search logs for indicators (mock implementation)"""
    # In practice, this would integrate with Elasticsearch, Splunk, etc.
    return [
        {
            "timestamp": "2025-08-05T10:30:00Z",
            "source": "firewall",
            "match_type": "ip_address",
```

```
            "confidence": 0.85
        }
    ]

    match_multiplier = len(matches) * 0.2
    return min(base_score + match_multiplier, 1.0)
```

3. API Service for External Integration

```typescript
```

```typescript
// api/cti-service.ts
import express from 'express';
import cors from 'cors';
import { CTIPlatformSDK } from '../sdk/cti-platform-sdk';
import { CTI_CONFIG } from '../config/production';

const app = express();
app.use(cors());
app.use(express.json());

const sdk = new CTIPlatformSDK(CTI_CONFIG);

// Health check endpoint
app.get('/health', async (req, res) => {
  try {
    const stats = await sdk.getPlatformStats();
    res.json({
      status: 'healthy',
      platform_stats: stats,
      timestamp: new Date().toISOString()
    });
  } catch (error) {
    res.status(500).json({
      status: 'unhealthy',
      error: error.message
    });
  }
});

// Get platform statistics
app.get('/api/v1/stats', async (req, res) => {
  try {
    const stats = await sdk.getPlatformStats();
    res.json(stats);
  } catch (error) {
    res.status(500).json({ error: error.message });
  }
});

// Get recent threat intelligence
app.get('/api/v1/intelligence/recent', async (req, res) => {
  try {
    const limit = parseInt(req.query.limit as string) || 50;
```

```
    const events = await sdk.getRecentEvents(limit);

    const intelligence = events
      .filter(event => event.type.includes('IntelligenceSubmitted'))
      .map(event => ({
        id: event.parsedJson.intelligence_id,
        threat_type: event.parsedJson.threat_type,
        confidence_score: event.parsedJson.confidence_score,
        submission_time: event.parsedJson.submission_time,
        submitter: event.parsedJson.submitter
      }));

    res.json(intelligence);
  } catch (error) {
    res.status(500).json({ error: error.message });
  }
});

// Submit new threat intelligence
app.post('/api/v1/intelligence/submit', async (req, res) => {
  try {
    const {
      privateKey,
      profileObjectId,
      intelligenceData,
      submissionFee
    } = req.body;

    const keypair = CTIPlatformSDK.createKeypairFromPrivateKey(privateKey);

    const txDigest = await sdk.submitIntelligence(
      keypair,
      profileObjectId,
      intelligenceData,
      submissionFee
    );

    res.json({
      success: true,
      transaction_digest: txDigest
    });
  } catch (error) {
    res.status(400).json({
      success: false,
```

```
      error: error.message
    });
  }
});

// Validate threat intelligence
app.post('/api/v1/intelligence/validate', async (req, res) => {
  try {
    const {
      privateKey,
      validatorProfileId,
      intelligenceObjectId,
      validationData
    } = req.body;

    const keypair = CTIPlatformSDK.createKeypairFromPrivateKey(privateKey);

    const txDigest = await sdk.validateIntelligence(
      keypair,
      validatorProfileId,
      intelligenceObjectId,
      validationData
    );

    res.json({
      success: true,
      transaction_digest: txDigest
    });
  } catch (error) {
    res.status(400).json({
      success: false,
      error: error.message
    });
  }
});

// Get threat analytics
app.get('/api/v1/analytics/trends', async (req, res) => {
  try {
    const timeframe = parseInt(req.query.timeframe as string) || 24;
    const analytics = new CTIAnalytics(sdk);
    const trends = await analytics.analyzeThreatTrends(timeframe);

    res.json(trends);
```

```
  } catch (error) {
    res.status(500).json({ error: error.message });
  }
});

const PORT = process.env.PORT || 3000;
app.listen(PORT, () => {
  console.log(`CTI Platform API server running on port ${PORT}`);
});

export default app;
```

Maintenance and Updates

1. Smart Contract Upgrades

```bash
# Create upgrade script
#!/bin/bash
# upgrade.sh

echo "Starting smart contract upgrade process..."

# Build new version
sui move build

# Test on local network first
sui client publish --gas-budget 100000000

# If tests pass, deploy to testnet
sui client switch --env testnet
sui client publish --gas-budget 100000000

echo "Upgrade completed successfully"
```

2. Database Migration (if using off-chain storage)

```sql
```

```sql
-- migrations/001_add_intelligence_cache.sql
CREATE TABLE intelligence_cache (
    id VARCHAR(66) PRIMARY KEY,
    threat_type VARCHAR(50) NOT NULL,
    severity INTEGER NOT NULL,
    confidence_score INTEGER NOT NULL,
    submission_time BIGINT NOT NULL,
    is_verified BOOLEAN DEFAULT FALSE,
    submitter_address VARCHAR(66) NOT NULL,
    created_at TIMESTAMP DEFAULT CURRENT_TIMESTAMP,
    updated_at TIMESTAMP DEFAULT CURRENT_TIMESTAMP
);

CREATE INDEX idx_threat_type ON intelligence_cache(threat_type);
CREATE INDEX idx_submission_time ON intelligence_cache(submission_time);
CREATE INDEX idx_is_verified ON intelligence_cache(is_verified);
```

3. Backup and Recovery

```bash
#!/bin/bash
# backup.sh

# Backup configuration
cp -r config/ backup/config_$(date +%Y%m%d_%H%M%S)/

# Export important object IDs
echo "PACKAGE_ID=$PACKAGE_ID" > backup/deployment_$(date +%Y%m%d_%H%M%S).env
echo "PLATFORM_OBJECT_ID=$PLATFORM_OBJECT_ID" >> backup/deployment_$(date +%Y%m%d_%H%M%S).env

# Backup logs
tar -czf backup/logs_$(date +%Y%m%d_%H%M%S).tar.gz logs/

echo "Backup completed successfully"
```

Conclusion

This deployment guide provides a comprehensive roadmap for implementing the first CTI sharing platform on Sui blockchain. The combination of Move smart contracts, TypeScript SDK, Python testing framework, and integration examples creates a complete ecosystem for secure, scalable, and efficient cyber threat intelligence sharing.

Key Advantages Demonstrated:

1. **Cost Efficiency**: 90%+ reduction in transaction costs compared to Ethereum
2. **Performance**: Sub-second finality and high throughput capabilities
3. **Security**: Move language eliminates common smart contract vulnerabilities
4. **Scalability**: Parallel transaction processing enables real-time CTI sharing
5. **Compliance**: Built-in GDPR compliance and privacy features

Next Steps:

1. Deploy to Sui mainnet when ready for production
2. Integrate with existing cybersecurity tools and SIEM systems
3. Build community of CTI sharing participants
4. Continuously monitor and optimize performance
5. Expand features based on user feedback and requirements

This implementation represents a significant advancement in blockchain-based cybersecurity applications and establishes a foundation for the future of collaborative threat intelligence sharing.
